

# Challenges of Training Software Testers

Jesse Rosenthal  
ASQ CMQ/OE, CSQE  
16 JAN 2008

# Assumptions

- ▶ Everything is open to debate and discussion!

# My Background

- ▶ Coordinate (and have managed/conducted) software testing for Department of Defense Military Health System (MHS) Resources Information Technology Program Office (RITPO) since 2003
- ▶ Project Management course development and instructor
- ▶ Division Lead for Capability Maturity Model (CMM) level 2/3 implementation
- ▶ Associate Referee Instructor for United States Soccer Federation

# Why test? Customer expectations

- ▶ Decrease risk
- ▶ Decrease uncertainty
- ▶ Increase knowledge
- ▶ Confirm expected results can be obtained by users in addition to the developer

# Testing Practical Exercise

- ▶ Task: Begin a software system integration test in 1 month.
- ▶ Industry:
  - Pharmacy
  - Banking
  - Insurance

# Internal vs. External Test Teams

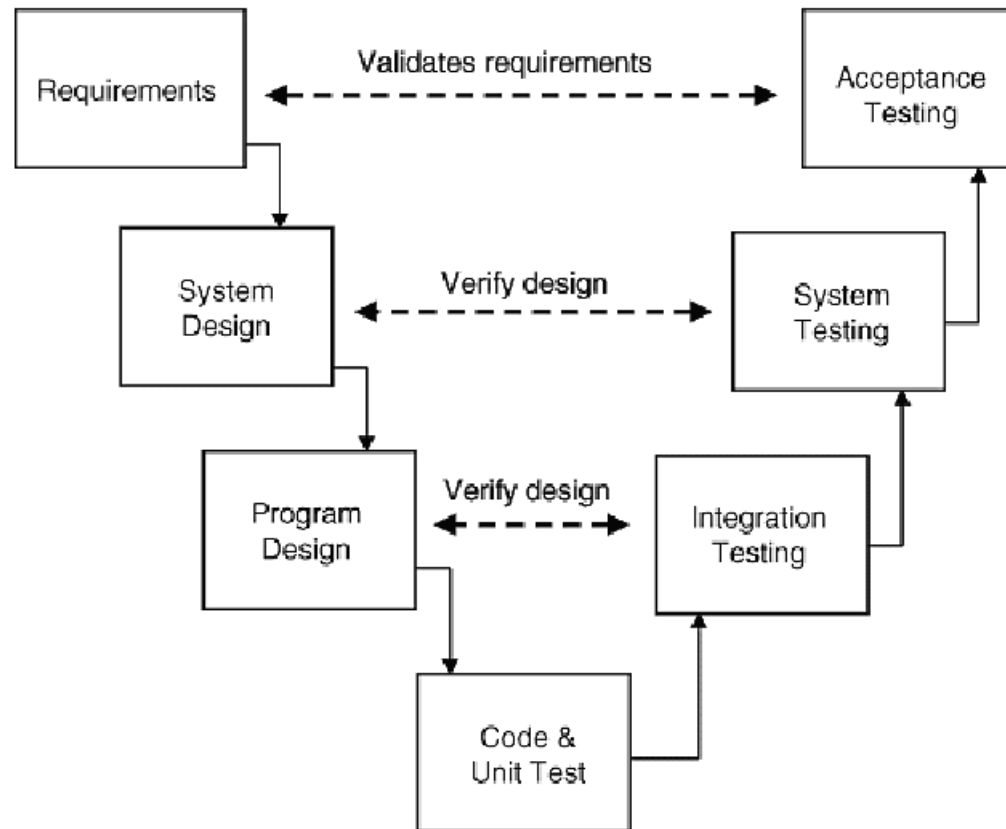

## ▶ Internal Test Team

- ▶ Ready access to developers to clarify
- ▶ Temptation to reuse developers in testing role
- ▶ Nominally lower accounting costs

## External Test Team

- Easier to preserve independence of testing, validity
- Higher accounting costs, if not necessarily economic costs

# Where does testing meet design?

# Testing starts with Good Requirements ...

- ▶ But what makes a requirement good?

# Attributes of Good Requirements

- ▶ Singular condition to evaluate
- ▶ Shall statements
- ▶ Unambiguous

NO WHITE  
ELEPHANTS!

- San Diego Zoo -

# Attributes of GOOD Testing

- ▶ Provides information about capabilities of system under test.
- ▶ Follows documented plans & procedures
- ▶ Evaluates whether each approved requirement has been demonstrated
- ▶ Evaluates whether the system is robust
- ▶ Thorough documentation of issues where expected results do not match actual results
- ▶ Evaluates whether the system under test provides graceful error-handling

# Attributes of GOOD Testing

- ▶ Takes place against defined software baseline
- ▶ Takes place in controlled software environment
- ▶ Performed by independent evaluator

▶ Not all testing  
is good

# Attributes of BAD testing

- ▶ Results are not documented
- ▶ Actual results of testing are not compared to expected results

▶ With an unlimited testing budget ...

# But seriously ...

- ▶ We can only hire one tester to add to the test team. Given the background of the following 4 candidates, who can contribute to our testing success?

# Candidates: Preliminary Ranking

- ▶ \_\_\_) Quality Assurance specialist who is relocating from Milwaukee. Having substantial shop floor experience inside a tire factory performing lot inspections, HR says that he taught Deming everything he knew – or at least that’s the impression from the phone screen.
- ▶ \_\_\_) Community banker who says that she has seen enough HUD-1 statements and consumer credit reports to last a lifetime. Wants to try something else.

# Candidates: Preliminary Ranking

- ▶ \_\_\_) Pharmacist with 2 years experience who scoured the Web looking for the company who tested the last software product installed in his pharmacy. Intends to vent at first opportunity (read: interview panel) to explain how poor their existing testers are and that a trained monkey could take a break from organ grinding and do a better job.
- ▶ \_\_\_) Software tester with 10 years of experience in aviation software evaluation.

# Who to Hire?

- ▶ Detail-oriented
- ▶ Inquisitive
- ▶ “Missouri mentality”
- ▶ Open-minded
- ▶ Honest
- ▶ Responsible

# Hiring a tester makes sense ...

- ▶ ... but should we train the tester?
- ▶ Or see what happens tabula rasa?

# If I don't train the testers, what are the savings?

- ▶ Schedule
- ▶ Budget

If I DO train the testers ...

▶ Are there benefits?

# Should the developer want to provide product training to the test team?

- ▶ Dry-run for the trainer in classroom model
- ▶ Allows controlled, professional assessment of strengths and weaknesses of training approach
- ▶ Allow development of FAQ list for eventual deployment target audience
- ▶ Gaps in training will be readily identified and addressed before Help Desk activation

# Should independent test manager deploy testers to developer training?

- ▶ Provides focus on real issues, not misunderstandings driven by unfamiliarity with the system
- ▶ Decrease ramp up time to develop and execute scripts
- ▶ Limit inefficiencies by not forcing the testers into trial-and-error mode, expand automated testing scope with more sophisticated product understanding
- ▶ Identify risks to success with deployment of system under test with training and documentation

# Aside from product training ... What training does a software tester need?

- ▶ Test Tools
- ▶ Test Processes and Procedures
- ▶ Issue Documentation Procedures
- ▶ Communication protocols

• Industry knowledge/context  
to understand what  
requirements capture

Requirements management?

# Transition – Hiring to Testing

- ▶ We will now assume that each of you has hired the right tester for your team.
- ▶ Now what?

# Tester Communication Expectations

- ▶ Fact-driven
- ▶ Fact-limited
- ▶ Clarity

# Traceability

- ▶ Mapping Requirements to Testing
- ▶ Mapping Training to Requirements
- ▶ Mapping Manual/Exploratory Testing to Legacy Training/Industry Knowledge

▶ Should we use customers as beta testers?

# Tester Incentives – Separate Good from Bad

- ▶ Tie compensation to number of issues detected?
- ▶ Tie compensation to number of test scripts/cases executed?
- ▶ Tie compensation to completion of testing on schedule?
- ▶ Tie compensation to completion of testing within budget?

# Satisfy customer expectations

- ▶ Has testing reduced the risks of deployment?
- ▶ Has testing increased confidence in expected results?

# Adding more testers ...

- ▶ If test team has been given training already, do you need to freeze hiring?
- ▶ No –you can measure knowledge retention in a trained tester by asking a legacy tester to present training to the new team member
